

The goal of this exercise is to build a “Purchase Summary” user interface using **React**. You have time 24 hours for this.

Key UI Elements:

- The “Pickup savings” tooltip
- The “See item details” expander
- The “Apply Promo code” expander

The user should be able to enter a promo code “DISCOUNT” and on applying it, see a 10% discount reflect in the purchase summary. Use **Redux** for this.

Please refrain from using existing React components out there to help building this. For the pricing data, you can hard code it to an object/json and read from it.

Build your UI on CodeSandbox and share the url when ready.

- Feel free to use your own workflow too if easier and upload your project files to a GitHub repo along with instruction for loading it up and testing on my end.

Reusability of component is a key factor to consider. You’ll be evaluated based on code correctness and quality.
